Not set

Trigger - OCR Watch Region

Draw the rectangle over the area that shows the payout / result number. When OCR reads the Trigger Value below, the betting cycle

Draw Trigger Region

Preview OCR

Not set

Trigger Value - cycle starts when OCR matches: 100.00

Timing

Action Delay (wait after trigger fires): 2.0 seconds

Cooldown (wait after clicks before next hand): 12.0 seconds

Session Limits

End Timer: 0 min (0 = run forever)

Max Loss: 0.00 (0 = disabled)

☒ From peak balance

Max Win (stop when balance rises this much from start): 0.00 (0 = disabled)

Max Loss baseline: starting balance by default. Tick "From peak balance" to use the highest balance seen instead (trailing stop-loss).

Start

Stop

Idle

Once logged in, you will need to Install Tesseract using the link at the top of the screen. Once installed, you may need to restart the app.

The app works by looking at specific fields that you, as the user setup and configure.

The first field will read your balance. Depending on the site you are using, try to select just the dollar amount. If your site uses special coins or currency, try to select JUST the numerical value. You can test this reading by using the Preview OCR after you select the field.

The next field is your Trigger. This will need to be something that changes on the screen when a new hand or game starts. Most sites bring up the chip selection between hands. You can read a specific chip value, for example 25. Once selected use the Preview OCR button to verify the read. If the value is correct, then you need to type that value in the Trigger Value box.

Note – Once these are set and the app is running, you should not move or minimize the table window. You should also not move any windows in front of these fields. Keep in mind this app will automatically be clicking on the betting spaces, so it is best to let your script run and not use this computer while it is running.

The next session is Timing. These are pre-configured but can be changed if needed. The First timer is a slight delay to help the app from reacting too fast after each hand. The second timer is a cooldown AFTER acting on the trigger. Depending on how fast your hands are being dealt, you may need to change this timer up or down.

Finally, we have the session limits. These limits tell the app when to stop the script.

End Timer – Stops the app after a set period of minutes – 0 means runs indefinitely (We do not recommend this as your account may get banned)

Max Loss – This reads your initial balance and will stop the script once your balance drops this amount. The From Peak Balance checkbox will adjust your balance as your balance grows. If you go on a winning spree, your balance grows and the max loss value is reflected on that peak balance

Max Win – This will stop the script once your balance increases by this amount

Step 1 — Named Click Spots

Define the clickable areas on your Baccarat table. Click **Capture** for a row, move your mouse over the target button on screen, then record that position.

Name	X	Y	Status	Capture
Player Bet			Not set	Capture
Banker Bet			Not set	Capture
Re-Bet			Not set	Capture

+ Add Spot

Remove Selected

Strategy

Saved Strategy: — select a strategy —

Save Strategy

Step 2 — IF / THEN Rules

Build your betting logic. Multiple rules can fire for the same condition and execute top-to-bottom.

Example: IF WIN -> Player Bet x1 | IF LOSS -> Banker Bet x1 | IF TIE -> Re-Bet x1

IF (Condition)	THEN — Click Spot	# Clicks	Delay (ms)
WIN (balance ↑) ▾	Player Bet ▾	1 ▴ ▾	200 ms ▴ ▾
LOSS (balance ↓) ▾	Re-Bet ▾	2 ▴ ▾	200 ms ▴ ▾
LOSS (balance ↓) ▾	Player Bet ▾	1 ▴ ▾	200 ms ▴ ▾
TIE (no change) ▾	Player Bet ▾	1 ▴ ▾	200 ms ▴ ▾
TIE (no change) ▾	Player Bet ▾	1 ▴ ▾	200 ms ▴ ▾

+ Add Rule

The Login builder tab is where you as the user program your strategies and tell the app where to place the bets.

In Step 1 – named Click Spots you capture the locations on your screen for the specific bets. You can add and remove spots based on your personal preferences

In Step 2 – If/Then Rules – You are creating your strategies. If a Win, Then Click Here for example. **Keep in mind, this process currently reads this entire section from top to bottom each game.** So if you have multiple things that happen if you win, then they will all happen EVERY win. You can change the number of clicks for each step as well as a delay if your site is not as responsive to faster double clicking.

Once you have a strategy that you love, you can Save the Strategy and name it accordingly. This allows you to use them again and again without building. **NOTE – You will still need to setup the Configuration tab and Step 1 in the Logic Builder each time you open the app.**

Now you can click Start in the app and the script will start running. If you have been playing on the website without closing the page, and you are using the rebet button, it is recommended to make a manual bet after starting the app. This also allows you as the user to make sure you have the correct chip selected as the app will not pick a dollar amount to bet, it will just bet according to the chip you select.

When you click Start, the app will swap to the log screen. At the top you will see running stats showing the hands played, the P&L (Profit and Loss) and the beginning balance. The log screen will show the actions of the script and if the app is not running correctly, these logs will tell us why. These logs are stored locally on your computer after each time using the application.

You have the option to Pause Script. This pauses the “clickable actions” of the app, but not the timer, the app itself or the logs from running. You can also Clear and Save the log files if you want to perform those actions as well.

If you have any other questions about the use or setup of this application, please reach out to our support team at Support@maxxedbets.com or use the Support Ticket form on our website. Thanks and Good Luck!
